

## **Answer to Some Selected Problems**

UNIT 8

8.25 15 g

UNIT 12

- 12.32 Mass of carbon dioxide formed = 0.505 g  
Mass of water formed = 0.0864 g

12.33 % fo nitrogen = 56

12.34 % of chlorine = 37.57

12.35 % of sulphur = 19.66

UNIT 13

13.9

*cis*-Hex-2-ene

*trans*-Hex-2-ene

The *cis* form will have higher boiling point due to more polar nature leading to stronger intermolecular dipole-dipole interaction, thus requiring more heat energy to separate them.

13.10 Due to resonance

13.11 Planar, conjugated ring system with delocalisation of  $(4n+2)\pi$  electrons, where,  $n$  is an integer

13.12 Lack of delocalisation of  $(4n+2)\pi$  electrons in the cyclic system.

13.13 (i)

(ii)

(iii)

Separation by  
fractional distillation

Cc1ccc(S(=O)(=O)O)cc1

13.14

15 H attached to 1° carbons

4 H attached to 2° carbons

1 H attached to 3° carbons

13.15 More the branching in alkane, lower will be the boiling point.

13.16 Refer to addition reaction of HBr to unsymmetrical alkenes in the text.

All the three products cannot be obtained by any one of the Kekulé's structures. This shows that benzene is a resonance hybrid of the two resonating structures.

13.18 H – C ≡ C – H > C<sub>6</sub>H<sub>6</sub> > C<sub>6</sub>H<sub>14</sub>. Due to maximum s orbital character in ethyne (50 per cent) as compared to 33 per cent in benzene and 25 per cent in *n*-hexane.

13.19 Due to the presence of  $6\pi$  electrons, benzene behaves as a rich source of electrons thus being easily attacked by reagents deficient in electrons.

13.22 (a) Chlorobenzene > *p*-nitrochlorobenzene > 2,4 – dinitrochlorobenzene  
 (b) Toluene > *p*-CH<sub>3</sub>-C<sub>6</sub>H<sub>4</sub>-NO<sub>2</sub> > *p*-O<sub>2</sub>N-C<sub>6</sub>H<sub>4</sub>-NO<sub>2</sub>

13.23 Toluene undergoes nitration most easily due to electron releasing nature of the methyl group.

13.24 FeCl<sub>3</sub>

13.25 Due to the formation of side products. For example, by starting with 1-bromopropane and 1-bromobutane, hexane and octane are the side products besides heptane.

## INDEX

A

- atomic radii
  - chemical properties
  - halides
  - hydration enthalpy
  - hydroxides
  - ionic radii
  - ionisation enthalpy
  - oxides
  - physical properties
  - reactivity towards air
  - reactivity towards dihydrogen
  - reactivity towards halogens
  - reactivity towards water
  - reducing nature
  - salts of oxoacids
  - solution in liquid ammonia
  - uses

Alkaline earth metals

  - atomic radii
  - carbonates
  - chemical properties
  - electronic configuration
  - halides
  - hydration enthalpies
  - hydroxides
  - ionic radii
  - ionisation enthalpies
  - nitrates
  - oxides
  - physical properties
  - reactivity towards air
  - reactivity towards halogens
  - reactivity towards water
  - reducing nature
  - salts of oxoacids
  - solution in liquid ammonia
  - uses
  - sulphates

Alkanes

  - aromatisation
  - chain isomerism
  - combustion
  - controlled oxidation
  - geometrical isomerism
  - halogenation
