

## Playing With numbers

### Factors and multiples:

- Factor of a number is an exact divisor of that number  
 $6 = 1 \times 6 = 2 \times 3$  : factors of 6 are 1, 2, 3 and 6
- Every number is a factor of itself and 1 is a factor of every number
- Every factor of a number is less than or equal to the given number
- Every number is a multiple of each of its factors  
 Factors of 12 are 1, 2, 3, 4, 6 and 12 :  $3 \times 4 = 12$ ,  $2 \times 6 = 12$ ,  $12 \times 1 = 12$
- Every multiple of a given number is greater than or equal to that number.
- Every number is a multiple of itself
- Factors of a given number are finite while its multiples are infinite
- If two given numbers are divisible by a number, then their sum (or difference) is also divisible by that number : 6 is divisible by 3, 18 is divisible by 3. Hence  $24 (= 18 + 6)$  and  $12 (= 18 - 6)$  are also divisible by 3
- A number for which sum of all its factors is equal to twice the number is called a perfect number : Ex. 6 and 28

### Prime and composite numbers:

- A number having only 2 factors, namely 1 and the number itself, is a prime number : 2, 3, 5, 7, 11 etc
- Numbers that have more than two factors are called composite numbers : 4, 6, 8, 9, 10, 12 etc
- Number 1 is neither prime nor composite.
- The number 2 is the smallest prime number and is even. Every prime number other than 2 is odd.
- Two numbers with only 1 as a common factor are called co-prime numbers : 15 and 16, 8 and 9, 25 and 33 etc
- If a number is divisible by another number then it is divisible by each of the factors of that number  
 $24$  is divisible by 8: it is also divisible by 2 and 4 which are factors of 8
- A number divisible by two co-prime numbers is divisible by their product  
 also 8 and 9 are co-primes and  $8 \times 9 = 72$   
 $144$  is divisible 9 :  $9 \times 16 = 144$ ,  $144$  is divisible by 8 :  $8 \times 18 = 144$   
 $144$  is also divisible by 72 (product of 8 and 9) :  $72 \times 2 = 144$

### Test of divisibility:

| By : | Criteria/ nature of the given number                                                                                                                                           | examples                                                                                                                   |
|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| 2    | Even numbers (0, 2, 4, 6 or 8 in its ones place)                                                                                                                               | 12, 148, 36, 100, 14                                                                                                       |
| 3    | sum of the digits is a multiple of 3                                                                                                                                           | 24: $2 + 4 = 6$<br>1566: $1 + 5 + 6 + 6 = 18$                                                                              |
| 4    | Last two digits should be both zeroes or divisible by 4                                                                                                                        | 100, 2400, 1936, 7848                                                                                                      |
| 5    | Number should have 0 or 5 in the ones place                                                                                                                                    | 15, 1125, 4560                                                                                                             |
| 6    | Number should be divisible by 2 and 3                                                                                                                                          | 48 : even and<br>$48 : 4 + 8 = 12$                                                                                         |
| 8    | Last three digits should be divisible by 8 or should be all zeroes                                                                                                             | 1000, 5000, 7024, 3144                                                                                                     |
| 9    | sum of the digits is a multiple of 9                                                                                                                                           | 144 : $1 + 4 + 4 = 9$<br>8631: $8 + 6 + 3 + 1 = 18$                                                                        |
| 10   | Number should have 0 in the ones place                                                                                                                                         | 10 20, 30, 56000, 900                                                                                                      |
| 11   | difference between the sum of the digits at odd places (from the right) and the sum of the digits at even places (from the right) of the number is either 0 or divisible by 11 | 61809 :<br>$9 + 8 + 6 = 23$ and<br>$0 + 1 = 1$<br>$23 - 1 = 22$<br>22 is divisible by 11<br>Other egs : 275,<br>1331, 6006 |

### Prime factorization:

Expressing a number as a product of its prime factors

The prime factorisation of 36 is  $= 2 \times 2 \times 3 \times 3$ . i.e. the only prime factorisation of 36.

### The Highest Common Factor(HCF)

- The HCF of two or more given numbers is the highest (or greatest) of their common factors.
- It is also known as Greatest Common Divisor (GCD)

|   |    |   |    |                                          |
|---|----|---|----|------------------------------------------|
| 2 | 20 | 2 | 28 | 20 = 2 x 2 x 5                           |
| 2 | 10 | 2 | 14 | 28 = 2 x 2 x 7                           |
| 5 | 5  | 7 | 7  | The common factors of 20 and 28 are 2, 2 |
| 1 | 1  | 1 | 1  | Hence HCF (20, 28) = $2 \times 2 = 4$    |

### The Lowest Common Multiple (LCM)

The LCM of two or more given numbers is the lowest (or smallest or least) of their common multiples

| Method 1                                                     |    |    |    |    |                                               |    |    |    |  |
|--------------------------------------------------------------|----|----|----|----|-----------------------------------------------|----|----|----|--|
| 2                                                            | 12 | 16 | 24 | 36 | 2                                             | 20 | 25 | 30 |  |
| 2                                                            | 6  | 8  | 12 | 18 | 2                                             | 10 | 25 | 15 |  |
| 2                                                            | 3  | 4  | 6  | 9  | 3                                             | 5  | 25 | 15 |  |
| 2                                                            | 3  | 2  | 3  | 9  | 5                                             | 5  | 25 | 5  |  |
| 3                                                            | 3  | 1  | 3  | 9  | 5                                             | 1  | 5  | 1  |  |
| 3                                                            | 1  | 1  | 1  | 3  |                                               | 1  | 1  | 1  |  |
|                                                              | 1  | 1  | 1  | 1  |                                               |    |    |    |  |
| LCM = $2 \times 2 \times 2 \times 2 \times 3 \times 3 = 144$ |    |    |    |    | LCM = $2 \times 2 \times 3 \times 5 \times 5$ |    |    |    |  |

### Method 2 : Finding the LCM of 24 and 90

The prime factorisations of 24 is given by :

$$24 = 2 \times 2 \times 2 \times 3$$

The prime factorisations of 90 is given by :

$$90 = 2 \times 3 \times 3 \times 5$$

- In these prime factorisations, the maximum number of times the prime factor 2 occurs is three; this happens for 24.
- Similarly, the maximum number of times the prime factor 3 occurs is two; this happens for 90
- The prime factor 5 occurs only once in 90
- Thus, LCM =  $(2 \times 2 \times 2) \times (3 \times 3) \times 5 = 360$
