

Chapter 11. Coordinate Geometry

Formulae

1. Distance Formula : The distance between the points P (x_1, y_1) and Q (x_2, y_2)

$$= \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

2. Section Formula : The co-ordinates of the point which divides the line segment joining the points P (x_1, y_1) and Q (x_2, y_2) in the ratio $m_1 : m_2$ are

$$\left(\frac{m_1 x_2 + m_2 x_1}{m_1 + m_2}, \frac{m_1 y_2 + m_2 y_1}{m_1 + m_2} \right)$$

3. Mid-point Formula : The co-ordinates of the mid-point of the line segment joining the points P (x_1, y_1) and Q (x_2, y_2) are

$$\left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2} \right)$$

4. Centroid Formula : The co-ordinates of the centroid of a triangle whose vertices are A (x_1, y_1), B (x_2, y_2) and C (x_3, y_3) are

$$\left(\frac{x_1 + x_2 + x_3}{3}, \frac{y_1 + y_2 + y_3}{3} \right)$$

5. Slope of a Straight Line :

(i) If the inclination of a line is θ ($\neq 90^\circ$), its slope = $m = \tan \theta$.

(ii) Slope of a line through (x_1, y_1) and ($x_2,$

y_2) is given by $m = \frac{y_2 - y_1}{x_2 - x_1}$.

6. Equation of a Straight Line :

(i) Equation of a line parallel to x -axis is $y = b$.

(ii) Equation of a line parallel to y -axis is $x = a$.

(iii) Equation of a line with slope m and y -intercept c is $y = mx + c$.

(iv) Equation of a line through (x_1, y_1) and with slope m is $y - y_1 = m(x - x_1)$.

7. Conditions of Parallelism and Perpendicularity : Two lines with slopes m_1 and m_2 are :

- (i) parallel if and only if $m_1 = m_2$.
- (ii) perpendicular if and only if $m_1 m_2 = -1$.

Formulae Based Questions

Question 1. Find the distance of the following points from origin.

- (i) (5, 6) (ii) (a+b, a-b) (iii) (a cos θ , a sin θ).

Solution : (i) Let O(0, 0) be the origin.

Distance between

O(0, 0) & P(5, 6)

$$\begin{aligned} OP &= \sqrt{(5-0)^2 + (6-0)^2} \\ &= \sqrt{25 + 36} = \sqrt{61} \text{ units.} \end{aligned} \quad \text{Ans.}$$

- (ii) Let P(a + b, a - b) and O(0, 0)

$$\begin{aligned} \text{Then } OP &= \sqrt{(a+b-0)^2 + (a-b-0)^2} \\ &= \sqrt{(a+b)^2 + (a-b)^2} \\ &= \sqrt{a^2 + b^2 + 2ab + a^2 + b^2 - 2ab} \\ OP &= \sqrt{2(a^2 + b^2)} \text{ units.} \end{aligned} \quad \text{Ans.}$$

- (iii) Let P(a cos θ , a sin θ) and O(0, 0)

$$\begin{aligned} \text{Then } |OP| &= \sqrt{(a \cos \theta - 0)^2 + (a \sin \theta - 0)^2} \\ &= \sqrt{a^2 \cos^2 \theta + a^2 \sin^2 \theta} \\ &= \sqrt{a^2 (\sin^2 \theta + \cos^2 \theta)} \\ &= a\sqrt{1} = a \text{ units.} \end{aligned} \quad \text{Ans.}$$

Question 2. Calculate the distance between A (7, 3) and B on the x-axis, whose abscissa is 11.

Solution: Here B is (11, 0)

$$\begin{aligned} AB &= \sqrt{(11-7)^2 + (0-3)^2} \\ &= \sqrt{(4)^2 + (-3)^2} \\ &= \sqrt{16 + 9} \\ &= \sqrt{25} = 5 \text{ units.} \end{aligned}$$

Question 3. KM is a straight line of 13 units If K has the coordinate (2, 5) and M has the coordinates (x, -7) find the possible value of x.

Solution : Using distance formula

$$\begin{aligned}
 & (x_2 - x_1)^2 + (y_2 - y_1)^2 = d^2 \\
 \Rightarrow & (x - 2)^2 + (-7 - 5)^2 = 13^2 \\
 \Rightarrow & x^2 - 4x + 4 + 144 = 169 \\
 \Rightarrow & x^2 - 4x + 148 - 169 = 0 \\
 \Rightarrow & x^2 - 4x - 21 = 0 \\
 \Rightarrow & x^2 - 7x + 3x - 21 = 0 \\
 \Rightarrow & (x - 7) + 3(x - 7) = 0 \\
 \Rightarrow & (x + 3)(x - 7) = 0 \\
 & x = 7, -3.
 \end{aligned}$$

Question 4. The midpoint of the line segment joining $(2a, 4)$ and $(-2, 2b)$ is $(1, 2a+1)$. Find the value of a and b .

show that the points $A(-1, 2)$, $B(2, 5)$ and $C(-5, -2)$ are collinear.

Solution : Midpoint of $(2a, 4)$ and $(-2, 2b)$ is $(1, 2a+1)$

$$\begin{array}{lcl}
 x = \frac{x_1 + x_2}{2} & & y = \frac{y_1 + y_2}{2} \\
 1 = \frac{2a - 2}{2} & & 2a + 1 = \frac{4 + 2b}{2} \\
 1 = a - 1 & & 2a + 1 = 2 + b \\
 \therefore a = 2 & & \therefore 5 - 2 = b \\
 & & \therefore b = 3
 \end{array}$$

Therefore, $a = 2$, $b = 3$.

Ans.

Question 5. Use distance formula to show that the points $A(-1, 2)$, $B(2, 5)$ and $C(-5, -2)$ are collinear.

Solution : If using distance formula we have to prove that A , B and C are collinear, then we have to show :

$$BC = AC + AB$$

$$\begin{aligned}
 \text{Hence } AB &= \sqrt{(5 - 2)^2 + (2 + 1)^2} = \sqrt{9 + 9} \\
 &= \sqrt{18} = 3\sqrt{2} \text{ units.}
 \end{aligned}$$

$$\begin{aligned}
 BC &= \sqrt{(-2 - 5)^2 + (-5 - 2)^2} \\
 &= \sqrt{49 + 49} = \sqrt{98} = 7\sqrt{2} \text{ units.}
 \end{aligned}$$

$$\begin{aligned}
 \text{and } AC &= \sqrt{(-2 - 2)^2 + (-5 + 1)^2} \\
 &= \sqrt{16 + 16} = \sqrt{32} = 4\sqrt{2} \text{ units.}
 \end{aligned}$$

$$\text{as } 7\sqrt{2} = 4\sqrt{2} + 3\sqrt{2}$$

$$\Rightarrow BC = AB + AC$$

$\Rightarrow$ Points A, B and C are collinear.

Hence proved.

Determine the Following

Question 1. PQ is straight line of 13 units. If P has coordinate (2, 5) and Q has coordinate (x, -7) find the possible values of x.

Solution : Here $PQ = 13$

$$PQ^2 = 13^2$$

$$\therefore (x-2)^2 + (-7-5)^2 = 169$$

$$\Rightarrow (x-2)^2 = 169 - 144 \\ = 25 = 5^2$$

$$\text{or } (x-2) = \pm 5$$

$$\Rightarrow x = 7 \text{ or } -3.$$

Question 2. Give the relation that must exist between x and y so that (x, y) is equidistant from (6, -1) and (2, 3).

Solution : Let P(x, y). A(6, -1) and B(2, 3) be the given points.

$$\text{Since } PA = PB$$

$$\text{So } \sqrt{(x-6)^2 + (y+1)^2} = \sqrt{(x-2)^2 + (y-3)^2}$$

Squaring both sides

$$x^2 + 36 - 12x + y^2 + 1 + 2y = x^2 + 4 - 4x + y^2 + 9 - 6y$$

$$\Rightarrow -8x + 8y = 13 - 36 - 1$$

$$\Rightarrow -8(x-y) = -24$$

$$\Rightarrow x - y = 3. \quad \text{Ans.}$$

Question 3. The line segment joining A (2, 3) and B (6, -5) is intersected by the X axis at the point K. Write the ordinate of the point K. Hence find the ratio in which K divides AB.

Solution: A (2, 3) and B (6, -5)

Intersected at X axis at K.

$$\therefore y = 0 \text{ or ordinate} = 0$$

$$K(x, 0)$$

Let required ratio be a : 1

$$\therefore \text{Ordinate of K} = 0$$

$$0 = \frac{a \times -5 + 1 \times 3}{a + 1}$$

$$0 = -5a + 3$$

$$5a = 3, a = \frac{3}{5}$$

$\therefore$ K divides AB in ratio of 3 : 5.

Question 4. Find the value of x so that the line passing through $(3, 4)$ and $(x, 5)$ makes an angle 135° with positive direction of X-axis.

Solution : Slope of the line which makes an angle 135° with X-axis,

$$m = \tan 135^\circ \\ = -1.$$

$$\text{Also slope } m = \frac{5-4}{x-3} = \frac{1}{x-3}$$

$$\text{Then, } \frac{1}{x-3} = -1$$

$$\Rightarrow x-3 = -1$$

$$\therefore x = 2.$$

Ans.

Question 5. Find the value, of k , if the line represented by $kx - 5y + 4 = 0$ and $4x - 2y + 5 = 0$ are perpendicular to each other.

Solution : Here, $kx - 5y + 4 = 0$

$$\Rightarrow y = \frac{kx}{5} + \frac{4}{5}$$

$\therefore$ The slope of the line is $\frac{k}{5}$.

Also $4x - 2y + 5 = 0$

$$y = 2x + \frac{5}{2}$$

$\therefore$ The slope of line is 2.

Since, the given lines are perpendicular to each other, we have

$$\left(\frac{k}{5}\right)(2) = -1 \Rightarrow k = \frac{-5}{2}.$$

Ans.

Question 6. Find the equation of a line which is inclined to x axis at an angle of 60° and its y - intercept = 2.

Solution : Hence, $m = \tan 60^\circ = \sqrt{3}$

and $c = 2$

The equation of line is given by

$$y = mx + c$$

$$y = \sqrt{3} \cdot x + 2$$

$$y = \sqrt{3}x + 2$$

$$\sqrt{3}x - y + 2 = 0.$$

Ans.

Question 7. Find the equation of a line with slope 1 and cutting off an intercept of 5 units on Y-axis.

Solution: We have

Slope of the line $m = 1$

and Y-intercept, $c = 5$ units

The equation of line is given by

$$y = mx + c$$

$$\text{i.e., } y = 1 \cdot x + 5$$

$$\Rightarrow y = x + 5$$

$$\text{or } x - y + 5 = 0.$$

Question 8. Find the equations of a line passing through the point (2, 3) and having the x - intercept of 4 units.

Solution : Since x-intercept is 4 units coordinates of point are (4, 0). Equation of a line passing through (2, 3) and (4, 0) is

$$y - y_1 = \frac{y_2 - y_1}{x_2 - x_1} (x - x_1)$$

$$\Rightarrow y - 3 = \frac{0 - 3}{4 - 2} (x - 2)$$

$$\Rightarrow y - 3 = \frac{-3}{2} (x - 2)$$

$$\Rightarrow 2y - 6 = -3x + 6$$

$$\Rightarrow 3x + 2y = 12. \quad \text{Ans.}$$

Question 9. The line through A (- 2, 3) and B (4, b) is perpendicular to the line $2x - 4y = 5$. Find the value of b.

Solution : Slope of AB = $\frac{b-3}{4+2}$

$$m_1 = \frac{b-3}{6}$$

$$\Rightarrow 2x - 4y = 5$$

$$\Rightarrow 4y = 2x - 5$$

$$\Rightarrow y = \frac{1}{2}x - \frac{5}{4}$$

$$\text{Slope } (m_2) = \frac{1}{2}$$

Since both lines are perpendicular to each other

so, $m_1 \cdot m_2 = -1$

$$\frac{b-3}{6} \cdot \frac{1}{2} = -1$$

$$b-3 = -12$$

$$b = -9.$$

Ans.

Question 10. Given that $(a, 2a)$ lies on line $\frac{y}{2} = 3x - 6$. Find the value of a .

Solution : Point $(a, 2a)$ lies on the line

$$\frac{y}{2} = 3x - 6$$

$$\therefore \frac{2a}{2} = 3a - 6$$

$$\Rightarrow a = 3a - 6$$

$$\Rightarrow 2a = 6$$

$$\Rightarrow a = 3.$$

Ans.

Question 11. Find the equation of a straight line which cuts an intercept of 5 units on Y-axis and is parallel to the line joining the points $(3, -2)$ and $(1, 4)$.

Solution : Let m be the slope of the required line and since the required line is parallel to the line joining the points $(3, -2)$ and $(1, 4)$.

Hence, slope of the line

$$m = \frac{4+2}{1-3}$$

$$= \frac{6}{-2}$$

$$= -3.$$

Also, Y-intercept $c = 5$ units.

So, equation of the required line be

$$y = mx + c$$

$$\Rightarrow y = -3x + 5$$

$$\Rightarrow 3x + y - 5 = 0.$$

Ans.

Question 12. Find the equation of a line that has Y-intercept 3 units and is perpendicular to the line joining $(2, -3)$ and $(4, 2)$.

Solution : Let m be the slope of required line .

$$\text{Slope of the given line} = \frac{2+3}{4-2} = \frac{5}{2}.$$

But the required line is perpendicular to the given line.

Hence,

$$m \times \text{Slope of the given line} = -1$$

$$\Rightarrow m \times \frac{5}{2} = -1$$

$$\Rightarrow m = \frac{-2}{5}$$

$$\text{Y-intercept, } c = 3$$

Hence, equation of the required line is given by

$$y = mx + c$$

$$\text{i.e., } y = -\frac{2}{5}x + 3$$

$$\Rightarrow 5y = -2x + 15$$

$$\Rightarrow 2x + 5y - 15 = 0. \quad \text{Ans.}$$

Question 13. Find a general equation of a line which passes through:

(i) $(0, -5)$ and $(3, 0)$ (ii) $(2, 3)$ and $(-1, 2)$.

Solution : We have the equation of a line which passes through (x_1, y_1) and (x_2, y_2) is

$$y - y_1 = \frac{y_2 - y_1}{x_2 - x_1} (x - x_1)$$

(i) Putting $x_1 = 0, y_1 = -5$ and $x_2 = 3, y_2 = 0$

$$y - (-5) = \frac{0 - (-5)}{3 - 0} (x - 0)$$

$$\Rightarrow y + 5 = \frac{5}{3} (x - 0)$$

$$\Rightarrow 3y + 15 = 5x$$

$$\Rightarrow 5x - 3y - 15 = 0$$

which is the required equation. Ans.

(ii) Putting $x_1 = 2, y_1 = 3$ and $x_2 = -1, y_2 = 2$

$$y - 3 = \frac{2 - 3}{-1 - 2} (x - 2)$$

$$\Rightarrow y - 3 = \frac{-1}{-3} (x - 2)$$

$$\Rightarrow 3y - 9 = (x - 2)$$

$$\Rightarrow x - 2 - 3y + 9 = 0$$

$$\Rightarrow x - 3y + 7 = 0$$

which is the equation of the required line.

$$\Rightarrow 3y - 9 = (x - 2)$$

$$\Rightarrow x - 2 - 3y + 9 = 0$$

$$\Rightarrow x - 3y + 7 = 0$$

which is the equation of the required line.

Question 14. Find the equation of the line passing through (0, 4) and parallel to the line $3x + 5y + 15 = 0$.

Solution : Since line is parallel to

$$3x + 5y + 15 = 0$$

$$5y = -3x - 15$$

$$y = \frac{-3}{5}x - 3$$

$$\therefore m_1 = \frac{-3}{5}$$

$$m_1 = m_2$$

($\because$ lines are parallel)

$$\therefore m_2 = \frac{-3}{5}$$

and passing point = (0, 4)

Equation of line

$$y - y_1 = m(x - x_1)$$

$$\Rightarrow y - 4 = \frac{-3}{5}(x - 0)$$

$$\Rightarrow 5y - 20 = -3x$$

$$\Rightarrow 3x + 5y = 20. \quad \text{Ans.}$$

Question 15. Find the equation of a line passing through (3, -2) and perpendicular to the line.

$$x - 3y + 5 = 0$$

Solution : $x - 3y + 5 = 0$

$$\Rightarrow 3y = x + 5$$

$$\therefore y = \frac{x}{3} + \frac{5}{3}$$

$$\therefore m_1 = \frac{1}{3}$$

Since lines are perpendicular to each other

$$\therefore m_1 \times m_2 = -1$$

$$\frac{1}{3} \times m_2 = -1$$

$$m_2 = -1 \times 3$$

$$m_2 = -3$$

Passing point is (3, -2)

$\therefore$ Equation of line

$$y - y_1 = m(x - x_1)$$

$$\Rightarrow y + 2 = -3(x - 3)$$

$$\Rightarrow y + 2 = -3x + 9$$

$$\Rightarrow 3x + y + 2 - 9 = 0$$

$$\Rightarrow 3x + y = 7.$$

Question 16. Find the equation of the straight line which has Y-intercept equal to $\frac{4}{3}$ and is perpendicular to $3x - 4y + 11 = 0$.

Solution : Equation of the given line is

$$3x - 4y + 11 = 0$$

Slope of this line $y = mx + c$

$$4y = 3x + 11$$

$$y = \frac{3}{4}x + \frac{11}{4}$$

$$m_1 = \frac{3}{4}$$

Let m_2 be the slope of the line which is perpendicular to the given line then

$$m_1 m_2 = -1$$

$$\frac{3}{4} m_2 = -1$$

$$\Rightarrow m_2 = -\frac{4}{3}$$

Also, Y-intercept $c = \frac{4}{3}$

Equation of the required line

$$y = m_2 x + c$$

$$y = -\frac{4}{3}x + \frac{4}{3}$$

$$\Rightarrow 3y = -4x + 4$$

$$\Rightarrow 4x + 3y - 4 = 0. \quad \text{Ans.}$$

Question 17. Find the equation of the straight line perpendicular to $5x - 2y = 8$ and which passes through the mid-point of the line segment joining $(2, 3)$ and $(4, 5)$.

Solution : $5x - 2y = 8$

$$2y = 5x - 8$$

$$\Rightarrow y = \frac{5}{2}x - 4$$

$$y = mx + c$$

$$\therefore m_1 = \frac{5}{2}$$

Since lines are perpendicular to each other

$$\therefore m_1 \times m_2 = -1$$

$$\frac{5}{2} \times m_2 = -1$$

$$m_2 = -1 \div \frac{5}{2}$$

$$m_2 = -\frac{2}{5}$$

Coordinates of midpoints

$$= \frac{2+4}{2}, \frac{3+5}{2}$$

Passing Point = $(3, 4)$

$\therefore$ Equation of line,

$$y - y_1 = m(x - x_1)$$

$$\Rightarrow y - 4 = -\frac{2}{5}(x - 3)$$

$$\Rightarrow 5y - 20 = -2x + 6$$

$$\Rightarrow 2x + 5y = 26.$$

Question 18. A line passing through the points $(a, 2a)$ and $(-2, 3)$ is perpendicular to the line $4a + 3y + 5 = 0$. Find the value of a .

Solution : Let m_1 be the slope of the line joining at the points $(a, 2a)$ and $(-2, 3)$, then

$$m_1 = \frac{2a - 3}{a + 2}$$

Also slope of the line $4x + 3y + 5 = 0$

$$m_2 = -\frac{4}{3}$$

Since, both the lines are perpendicular.

So, $m_1 m_2 = -1$

$$\Rightarrow \frac{2a - 3}{a + 2} \times \frac{(-4)}{3} = -1$$

$$\Rightarrow 8a - 12 = 3a + 6$$

$$\Rightarrow 8a - 3a = 18$$

$$\Rightarrow 5a = 18$$

$$\Rightarrow a = \frac{18}{5}$$

$$\Rightarrow a = 3\frac{3}{5}$$

Prove the Following

Question 1. A line is of length 10 units and one end is at the point $(2, -3)$. If the abscissa of the other end be 10, prove that its ordinate must be 3 or -9 .

Solution : Let AB be the line of length 10 units
then A $(10, y)$

A	10 units	B
(2, -3)		(10, y)

$$\Rightarrow \sqrt{(2 - 10)^2 + (-3 - y)^2} = 10$$

Squaring both sides

$$\Rightarrow 64 + 9 + y^2 + 6y = 100$$

$$\Rightarrow y^2 + 6y + 73 - 100 = 0$$

$$\Rightarrow y^2 + 6y - 27 = 0$$

$$\Rightarrow y^2 + 9y - 3y - 27 = 0$$

$$\Rightarrow y(y + 9) - 3(y + 9) = 0$$

$$\Rightarrow (y + 9)(y - 3) = 0$$

$$\Rightarrow y = -9 \text{ or } y = 3$$

Ordinate is 3 or -9 .

Hence proved.

Question 2. Show that the line joining $(2, -3)$ and $(-5, 1)$ is:

(i) Parallel to line joining $(7, -1)$ and $(0, 3)$.

(ii) Perpendicular to the line joining $(4, 5)$ and $(0, -2)$.

Solution : Let m_1 be the slope of line joining $(2, -3)$ and $(-5, 1)$ then

$$\begin{aligned} m_1 &= \frac{y_2 - y_1}{x_2 - x_1} \\ &= \frac{1 - (-3)}{-5 - 2} = -\frac{4}{7} \end{aligned}$$

(i) Let m_2 be the slope of the line joining $(7, -1)$ and $(0, 3)$, then

$$m_2 = \frac{3 - (-1)}{0 - 7} = -\frac{4}{7}$$

Since, $m_1 = m_2$, the two lines are parallel.

Hence proved.

(ii) Let m_3 be the slope of the line joining $(4, 5)$ and $(0, -2)$ then

$$m_3 = \frac{-2 - 5}{0 - 4} = \frac{7}{4}$$

$$\text{Now } m_1 m_3 = -\frac{4}{7} \times \frac{7}{4} = -1$$

Hence, the two lines are perpendicular.

Hence proved.

Question 3. With out Pythagoras theorem, show that $A(4, 4)$, $B(3, 5)$ and $C(-1, -1)$ are the vertices of a right angled.

$$\text{Solution : Slope of BC} = m_1 = \frac{-1 - 5}{-1 - 3} = \frac{3}{2}$$

$$\text{Slope of CA} = m_2 = \frac{4 - (-1)}{4 - (-1)} = 1$$

$$\text{Also, slope of AB} = m_3 = \frac{5 - 4}{3 - 4} = -1$$

Since, $m_2 m_3 = 1 \times (-1) = -1$, So, AB and CA are perpendicular to each other.

Thus, $\triangle ABC$ is a right angled triangle at A.

Hence proved.

Question 4. Show that the points $A(-2, 5)$, $B(2, -3)$ and $C(0, 1)$ are collinear.

Solution : $m_1 = \text{Slope of AB}$

$$= \frac{-3 - 5}{2 - (-2)} = -\frac{8}{4} = -2$$

$m_2 = \text{slop of BC}$

$$= \frac{1 - (-3)}{0 - 2} = \frac{4}{-2} = -2.$$

Hence $m_1 = m_2 = -2$

So, AB is parallel to BC.

But B is common to AB and BC.

Hence, A, B and C must lie on the same line.

Hence proved.

Question 5. By using the distance formula prove that each of the following sets of points are the vertices of a right angled triangle.

(i) (6, 2), (3, -1) and (-2, 4)

(ii) (-2, 2), (8, -2) and (-4, -3).

Solution : (i) Let A(6, 2), B(3, -1) and C(-2, 4) be the given points

$$\begin{aligned} AB &= \sqrt{(6-3)^2 + (2+1)^2} \\ &= \sqrt{9+9} = \sqrt{18} = 3\sqrt{2} \text{ units.} \end{aligned}$$

$$\begin{aligned} BC &= \sqrt{(3+2)^2 + (-1-4)^2} \\ &= \sqrt{25+25} = 5\sqrt{2} \text{ units.} \end{aligned}$$

$$\begin{aligned} AC &= \sqrt{(6+2)^2 + (2-4)^2} \\ &= \sqrt{64+4} \\ &= \sqrt{68} \text{ units.} \end{aligned}$$

$$\begin{aligned} \text{Now } AB^2 + BC^2 &= (3\sqrt{2})^2 + (5\sqrt{2})^2 \\ &= 18 + 50 = 68 = AC^2 \\ AB^2 + BC^2 &= AC^2. \end{aligned}$$

Hence, the triangle is right angled at A.

Hence proved

(ii) Let A(-2, 2), B(8, -2) and C(-4, -3) be the given points

$$\begin{aligned} AB &= \sqrt{(8+2)^2 + (-2-2)^2} \\ &= \sqrt{116} \text{ units.} \end{aligned}$$

$$\begin{aligned} BC &= \sqrt{(8+4)^2 + (-2+3)^2} \\ &= \sqrt{145} \text{ units.} \end{aligned}$$

$$\begin{aligned} AC &= \sqrt{(-2+4)^2 + (2+3)^2} \\ &= \sqrt{29} \text{ units.} \end{aligned}$$

$$\begin{aligned} \text{Now } AB^2 + AC^2 &= 116 + 29 \\ &= 145 = BC^2 \end{aligned}$$

$$\text{Since } AB^2 + AC^2 = BC^2$$

Hence, the triangle is right angled at A.

Question 6. Show that each of the triangles whose vertices are given below are isosceles :

(i) (8, 2), (5, -3) and (0, 0)

(ii) (0, 6), (-5, 3) and (3, 1).

Solution : (i) Let A (8, 2), B (5, -3) and C (0, 0) be the given point

$$\begin{aligned}\text{Then } AB &= \sqrt{(8-5)^2 + (2+3)^2} \\ &= \sqrt{9+25} = \sqrt{34} \text{ units.}\end{aligned}$$

$$\begin{aligned}BC &= \sqrt{(5-0)^2 + (-3-0)^2} \\ &= \sqrt{25+9} = \sqrt{34} \text{ units.}\end{aligned}$$

$$\begin{aligned}AC &= \sqrt{(8-0)^2 + (2-0)^2} \\ &= \sqrt{64+4} = \sqrt{68} \text{ units.}\end{aligned}$$

$$\text{Here } AB = BC = \sqrt{34}.$$

Hence, the triangle is isosceles.

(ii) The given points are A(0, 6), B(-5, 3) and C(3, 1)

$$\begin{aligned}\text{Then } AB &= \sqrt{(0+5)^2 + (6-3)^2} \\ &= \sqrt{25+9} = \sqrt{34} \text{ units.}\end{aligned}$$

$$\begin{aligned}BC &= \sqrt{(-5-3)^2 + (3-1)^2} \\ &= \sqrt{64+4} = \sqrt{68} \text{ units.}\end{aligned}$$

$$\begin{aligned}\text{Also } AC &= \sqrt{(0-3)^2 + (6-1)^2} \\ &= \sqrt{9+25} = \sqrt{34} \text{ units.}\end{aligned}$$

$$\text{Since } AB = AC = \sqrt{34}$$

Hence, the triangle is an isosceles.

Hence proved.

Question 7. Show that the quadrilateral with vertices (3, 2), (0, 5), (-3, 2) and (0, -1) is a square.

Solution : Let A(3, 2), B(0, 5), C(-3, 2) and D(0, -1) are the vertices of quadrilateral.

$$\begin{aligned}\text{Now } AB &= \sqrt{(3-0)^2 + (2-5)^2} \\ &= \sqrt{18} \text{ units.}\end{aligned}$$

$$\Rightarrow AB^2 = 18$$

$$\begin{aligned}BC &= \sqrt{(0+3)^2 + (5-2)^2} \\ &= \sqrt{18} \text{ units.}\end{aligned}$$

$$\Rightarrow BC^2 = 18$$

$$\begin{aligned}CD &= \sqrt{(-3-0)^2 + (2+1)^2} \\ &= \sqrt{18} \text{ units.}\end{aligned}$$

$$\Rightarrow CD^2 = 18$$

$$\begin{aligned}\text{Also } AD &= \sqrt{(3-0)^2 + (2+1)^2} \\ &= \sqrt{18} \text{ units.}\end{aligned}$$

$$\Rightarrow AD^2 = 18.$$

$$\begin{aligned}\text{Here } AB &= BC = CD = DA \\ &= \sqrt{18} \text{ units.}\end{aligned}$$

$$\begin{aligned}\text{Also } AC^2 &= (3+3)^2 + (2-2)^2 \\ AC^2 &= 36\end{aligned}$$

$$\begin{aligned}\text{or } BD^2 &= (0-0)^2 + (5+1)^2 \\ &= 36\end{aligned}$$

$$\Rightarrow \text{Diagonal AC} = \text{BD}$$

Hence, ABCD is a square. Hence proved.

Question 8. Show that the points (a, a) , $(-a, -a)$ and $(-a\sqrt{3}, a\sqrt{3})$ are the vertices of an equilateral triangle.

Solution : The given points are let

$$A(a, a), B(-a, -a) \text{ and } C(-a\sqrt{3}, a\sqrt{3}).$$

$$\begin{aligned} AB &= \sqrt{(-a-a)^2 + (-a-a)^2} \\ &= \sqrt{4a^2 + 4a^2} = 2\sqrt{2} a \text{ units.} \end{aligned}$$

$$\begin{aligned} BC &= \sqrt{(-a\sqrt{3}+a)^2 + (a\sqrt{3}+a)^2} \\ &= \sqrt{3a^2 + a^2 - 2\sqrt{3}a^2 + 3a^2 + a^2 + 2\sqrt{3}a^2} \\ &= \sqrt{8a^2} = 2\sqrt{2} a \text{ units.} \end{aligned}$$

$$\begin{aligned} \text{and } CA &= \sqrt{(a\sqrt{3}-a)^2 + (-a\sqrt{3}-a)^2} \\ &= \sqrt{3a^2 + a^2 - 2\sqrt{3}a^2 + 3a^2 + a^2 + 2\sqrt{3}a^2} \\ &= \sqrt{8a^2} = 2\sqrt{2} a \text{ units.} \end{aligned}$$

$$\text{as } AB = BC = CA = 2\sqrt{2} a$$

$\Rightarrow \triangle ABC$ is an equilateral triangle.

Hence proved.

Question 9. If the point (x, y) is at equidistant from the point $(a+b, b-a)$ and $(a-b, a+b)$. Prove that $ay = bx$.

Solution : Given that (x, y) is equidistant from the points $(a+b, b-a)$ and $(a-b, a+b)$.

Hence, distance of (x, y) from both points will be same.

$$\begin{aligned} \text{Hence, } \sqrt{(y-b+a)^2 + (x-a-b)^2} \\ = \sqrt{(y-a-b)^2 + (x-a+b)^2} \end{aligned}$$

On squaring and expanding :

$$\begin{aligned} y^2 + b^2 + a^2 - 2by - 2ab + 2ay + x^2 + a^2 \\ + b^2 - 2ax + 2ab - 2bx \\ = y^2 + a^2 + b^2 - 2ay + 2ab - 2by + x^2 + a^2 \\ + b^2 - 2ax - 2ab + 2bx \end{aligned}$$

$$2ay - 2bx = 2bx - 2ay$$

$$4ay = 4bx$$

$$\Rightarrow \boxed{ay = bx} \quad \text{Hence proved.}$$

Question 10. Prove that $A(4, 3)$, $B(6, 4)$, $C(5, 6)$ and $D(3, 5)$ are the angular points of a square.

Solution : Now

$$\begin{aligned}AB &= \sqrt{(4-6)^2 + (3-4)^2} \\&= \sqrt{4+1} = \sqrt{5} \text{ units}\end{aligned}$$

$$BC = \sqrt{(6-5)^2 + (4-6)^2} = \sqrt{1+4}$$

$$BC = \sqrt{5} \text{ units}$$

$$CD = \sqrt{(5-3)^2 + (6-5)^2} = \sqrt{4+1}$$

$$CD = \sqrt{5} \text{ units}$$

Also
$$\begin{aligned}DA &= \sqrt{(4-3)^2 + (3-5)^2} \\&= \sqrt{1+4} = \sqrt{5}\end{aligned}$$

$$DA = \sqrt{5} \text{ units}$$

So
$$AB = BC = CD = DA.$$

$$\text{Now slope of } AB = m_1 = \frac{4-3}{6-4} = \frac{1}{2}$$

$$\text{Slope of } BC = m_2 = \frac{6-4}{5-6} = -1$$

$$\text{Slope of } CD = m_3 = \frac{5-6}{3-5} = \frac{1}{2}$$

$$\text{Slope of } DA = m_4 = \frac{5-3}{3-4} = -1$$

$$\text{Since } m_1 = m_3 \text{ and } m_2 = m_4$$

$$\text{So } AB \parallel CD$$

and
$$BC \parallel DA.$$

$$\text{Also, } m_1 m_2 = \frac{1}{2} \times \frac{2}{-1} = -1$$

$$\text{Therefore, } AB \perp BC$$

$$\therefore ABCD \text{ is a square.}$$

Hence proved.

Question 13. P and Q are two points whose coordinate are $(at^2, 2at)$, $\left(\frac{a}{t^2}, \frac{-2a}{t}\right)$ and S is the point $(a, 0)$. Prove that $\frac{1}{SP} + \frac{1}{SQ}$ is constant for all values of t.

Solution : The given points are $P(at^2, 2at)$, $Q\left(\frac{a}{t^2}, \frac{-2a}{t}\right)$ and $S(a, 0)$

$$\begin{aligned}\text{Now, } SP &= \sqrt{(at^2 - a)^2 + (2at - 0)^2} \\ &= \sqrt{a^2(t^4 + 1 - 2t^2) + 4a^2t^2} \\ &= a\sqrt{t^4 + 1 + 2t^2} \\ &= a\sqrt{(t^2 + 1)^2} \\ SP &= a(t^2 + 1) \text{ units.}\end{aligned}$$

$$\begin{aligned}\text{Also, } SQ &= \sqrt{\left(\frac{a}{t^2} - a\right)^2 + \left(\frac{-2a}{t} - 0\right)^2} \\ &= \sqrt{a^2\left(\frac{1}{t^4} + 1 - \frac{2}{t^2}\right) + \frac{4a^2}{t^2}} \\ &= a\sqrt{\frac{1}{t^4} + 1 + \frac{2}{t^2}} \\ &= a\sqrt{\left(\frac{1}{t^2} + 1\right)^2}\end{aligned}$$

Question 14. Show that the points A(1, 3), B(2, 6), C(5, 7) and D(4, 4) are the vertices of a rhombus.

$$\begin{aligned}&= a\left(\frac{1}{t^2} + 1\right) = \frac{a(t^2 + 1)}{t^2} \\ \text{Now } \frac{1}{SP} + \frac{1}{SQ} &= \frac{1}{a(t^2 + 1)} + \frac{1 \times t^2}{a(t^2 + 1)} \\ &= \frac{(1 + t^2)}{a(t^2 + 1)} \\ \frac{1}{SP} + \frac{1}{SQ} &= \frac{1}{a}.\end{aligned}$$

Solution : To show that ABCD is a rhombus, it is sufficient to show that

(i) ABCD is a parallelogram i.e., AC and BD have the same mid point.

(ii) A pair of adjacent sides are equal.

$$\text{Now, midpoint of AC} = \left(\frac{1+5}{2}, \frac{3+7}{2} \right) \\ = (3, 5).$$

$$\text{Midpoint of BD} = \left(\frac{4+2}{2}, \frac{4+6}{2} \right) \\ = (3, 5).$$

Thus, ABCD is a parallelogram.

$$\text{Also } AB^2 = (2-1)^2 + (6-3)^2 \\ = 1 + 9 = 10 \text{ units.}$$

$$BC^2 = (5-2)^2 + (7-6)^2 \\ = 9 + 1 = 10 \text{ units.}$$

$$\text{Therefore } AB^2 = BC^2 \Rightarrow AB = BC$$

Hence, ABCD is a rhombus.

Figure Based Questions

Question 1. If the line joining the points A (4, -5) and B(4, 5) is divided by the point P such that $\frac{AP}{AB} = \frac{2}{5}$, find the coordinates of P.

Solution : A(4, -5), B(4, 5)

$$\text{Given } \frac{AP}{AB} = \frac{2}{5}$$

$$\therefore \frac{AP}{PB} = \frac{2}{3}$$

Let coordinate of P(x, y).

Question 2. Determine the ratio in which the line $3x + y - 9 = 0$ divides the line joining $(1, 3)$ and $(2, 7)$.

Solution : Suppose the line $3x + y - 9 = 0$ divides the line joining $A(1, 3)$ and $B(2, 7)$ in the ratio of $\lambda : 1$ at point C .

$$\text{Coordinates of } C = \left(\frac{2\lambda + 1}{\lambda + 1}, \frac{7\lambda + 3}{\lambda + 1} \right)$$

But point C lies on the line $3x + y - 9 = 0$.

Therefore,

$$3 \left(\frac{2\lambda + 1}{\lambda + 1} \right) + \left(\frac{7\lambda + 3}{\lambda + 1} \right) - 9 = 0$$

$$\Rightarrow 6\lambda + 3 + 7\lambda + 3 - 9\lambda - 9 = 0$$

$$\Rightarrow 4\lambda - 3 = 0$$

$$\Rightarrow \lambda = \frac{3}{4}$$

The required ratio = $\lambda : 1$

= $3 : 4$. **Ans.**

Question 3. The midpoint of the line segment AB shown in the diagram is $(4, -3)$. Write down the coordinates of A and B .

Solution: Let the coordinates of A and B are $(x, 0)$ and $(0, y)$.

$$\text{so } x = \frac{mx_2 + nx_1}{m+n}, y = \frac{my_2 + ny_1}{m+n}$$

$$m = 2, n = 3$$

$$x_1 = 4, x_2 = 4$$

$$y_1 = -5, y_2 = 5$$

$$\therefore x = \frac{2 \times 4 + 3 \times 4}{2 + 3} = \frac{8 + 12}{5} = \frac{20}{5} = 4$$

$$y = \frac{2 \times 5 + 3 \times -5}{2 + 3}$$

$$= \frac{10 - 15}{5} = \frac{-5}{5} = -1$$

$\therefore$ Co-ordinates of P are $(4, -1)$.

Ans.

Thus, the coordinates of midpoints of

$$AB = \left(\frac{x+0}{2}, \frac{y+0}{2} \right) \\ = \left(\frac{x}{2}, \frac{y}{2} \right)$$

According to question, the coordinates of mid-point = $(4, -3)$

$$\therefore \frac{x}{2} = 4, \quad x = 8$$

$$\frac{y}{2} = -3, \quad y = -6$$

$\therefore$ The required points are $(8, 0)$ and $(0, -6)$.

Question 4. The centre 'O' of a circle has the coordinates $(4, 5)$ and one point on the circumference is $(8, 10)$. Find the coordinates of the other end of the diameter of the circle through this point.

Solution : Let (x, y) be the coordinates of the other end of the diameter of the circle.

Since, centre is the midpoint of the diameter of the circle.

So coordinates of midpoint of diameter

$$AB = \left(\frac{8+x}{2}, \frac{10+y}{2} \right)$$

But $O(4, 5)$ is the centre hence

$$\frac{8+x}{2} = 4 \Rightarrow x = 8 - 8 = 0.$$

Also $\frac{10+y}{2} = 5 \Rightarrow y = 10 - 10 = 0.$

Hence (0, 0) be the coordinates of the other end.

Question 5. In the following figure line APB meets the X-axis at A, Y-axis at B. P is the point (4, -2) and $AP : PB = 1 : 2$. Write down the coordinates of A and B.

Solution : Let $(x, 0)$ and $(0, y)$ be the coordinates of A and B respectively.

Point P divides AB in the ratio of 1 : 2.

So coordinates of P

$$4 = \frac{1 \times 0 + 2 \times x}{1 + 2}$$

$$\Rightarrow 2x = 4 \times 3$$

$$\Rightarrow x = 6$$

Also $-2 = \frac{2 \times 0 + 1 \times y}{1 + 2}$

$$\Rightarrow -6 = y$$

$$\Rightarrow y = -6.$$

Hence, the coordinates of A and B are $(-6, 0)$ and $(0, 6)$ respectively.

Ans.

Question 6. The three vertices of a parallelogram taken in order are $(-1, 0)$, $(3, 1)$ and $(2, 2)$ respectively. Find the coordinates of the fourth vertex.

Solution : Let A(-1, 0), B (3, 1), C (2, 2) and D (x, y) be the vertices of a parallelogram ABCD taken in order.

Since, the diagonals A(-1, 0) B(3, 1) of a parallelogram bisect each other.

So, coordinates of the mid point of AC = coordinates of mid point of BD

$$\Rightarrow \left(\frac{-1+2}{2}, \frac{0+2}{2} \right) = \left(\frac{3+x}{2}, \frac{y+1}{2} \right)$$

$$\Rightarrow \left(\frac{1}{2}, 1 \right) = \left(\frac{3+x}{2}, \frac{y+1}{2} \right)$$

$$\frac{3+x}{2} = \frac{1}{2} \Rightarrow x = -2$$

Also $\frac{y+1}{2} = 1 \Rightarrow y+1 = 2$

$$\Rightarrow y = 1$$

The fourth vertex of parallelogram = (-2, 1).

Question 7. Find the equation of a straight line which cuts an intercept - 2 units from Y-axis and being equally inclined to the axis.

Solution : Since, the required line is equally inclined with coordinate axis, therefore, it makes either an angle of 45° or 135° with the X-axis.

So, its slope is $m = \tan 45^\circ \Rightarrow m = 1$

or $m = \tan 135^\circ \Rightarrow m = -1$

Y-intercept, $c = -2$

Hence, the equation of required lines are

$$y = mx + c$$

i.e., $y = 1 \cdot x - 2$ or $y = -1 \cdot x - 2$

$$\Rightarrow y = x - 2 \text{ or } y = -x - 2$$

$$\Rightarrow x - y - 2 = 0 \text{ or } x + y + 2 = 0. \text{ Ans.}$$

Question 8. In $\triangle ABC$, A (3, 5), B (7, 8) and C (1, -10). Find the equation of the median through A.

Solution : Coordinates of

$$D \left(\frac{7+1}{2}, \frac{8-10}{2} \right) = (4, -1)$$

(Midpoint formula)

Now equation of AD (Median through A)

$$y - 5 = \frac{-1-5}{4-3}(x-3)$$

(Two point form)

$$y - 5 = -6(x-3)$$

$$y - 5 = -6x + 18$$

or $6x + y - 23 = 0.$ Ans.

Question 9. The figure alongside (not drawn to scale) represents the lines $y = x + 1$ and $y = \sqrt{3}x - 1$.

(i) Find the angle which the line $y = x + 1$ makes with X-axis.

(ii) Find the angle which the line $y = \sqrt{3}x - 1$ makes with X-axis.

(iii) Determine angle θ .

(iv) Find the point where the line $y = x + 1$ meets X-axis.

(v) Find the point where the line $y = \sqrt{3}x - 1$ meets Y-axis.

Solution : (i) $y = x + 1$

$$\Rightarrow m_1 = \tan \theta_1 = 1 = \tan 45^\circ$$

$$\Rightarrow \theta_1 = 45^\circ. \quad \text{Ans.}$$

(ii) $y = \sqrt{3}x - 1$

$$\Rightarrow m_2 = \tan \theta_2 = \sqrt{3} = \tan 60^\circ$$

$$\Rightarrow \theta_2 = 60^\circ. \quad \text{Ans.}$$

$$(iii) \therefore \theta = \theta_2 - \theta_1.$$

($\because$ Exterior $\angle$ = Sum of interior opposite $\angle$ s)

$$= 60^\circ - 45^\circ = 15^\circ. \quad \text{Ans.}$$

(iv) Put $y = 0$ in $y = x + 1$, we get

$$0 = x + 1$$

$$\Rightarrow x = -1$$

$\therefore$ The required point is $(-1, 0)$. Ans.

(v) Put $x = 0$ in $y = \sqrt{3}x - 1$, we get $y = -1$

$\therefore$ The required point is $(0, -1)$. Ans.

Question 10. In the adjoining figure, write

(i) The coordinates of A, B and C.

(ii) The equation of the line through A and || to BC.

Solution : (i) $A = (2, 3)$, $B = (-1, 2)$, $C = (3, 0)$.

Ans.

$$(ii) \quad \text{Slope of BC} = \frac{y_2 - y_1}{x_2 - x_1} = \frac{2 - 0}{-1 - 3} = \frac{2}{-4}$$

$$m_1 = \frac{-1}{2}$$

Since lines are parallel

$$\therefore m_1 = m_2$$

$$\text{Hence, } m_2 = -\frac{1}{2}$$

and passing through point $(2, 3)$

$$\therefore \text{Equation of line is } y - y_1 = m_2 (x - x_1)$$

$$\therefore \text{required line is } y - 3 = \frac{-1}{2} (x - 2)$$

$$2y - 6 = -x + 2$$

$$x + 2y = 8. \quad \text{Ans.}$$

Question 11. In the figure given below, the line segment AB meets X-axis at A and Y-axis at B. The point P (-3, 4) on AB divides it in the ratio 2 : 3. Find the coordinates of A and B.

Solution : $AP : PB = 2 : 3$

Let A (x, 0) and B (0, y)

∴ By section formula

$$\frac{2 \times 0 + 3 \times x}{2 + 3} = -3$$

$$\Rightarrow 3x = -15$$

$$x = -5$$

and $\frac{2 \times y + 3 \times 0}{2 + 3} = 4$

$$\Rightarrow 2y = 20$$

$$\Rightarrow y = 10$$

∴ Coordinates of A $\equiv (x, 0) \equiv (-5, 0)$

and B $\equiv (0, y) \equiv (0, 10).$

Question 12. Determine the centre of the circle on which the points (1, 7), (7 - 1), and (8, 6) lie. What is the radius of the circle ?

Solution : Let $P(x, y)$ be the centre of the circle and $A(1, 7)$, $B(7, -1)$ and $C(8, 6)$ be the given points.

Then $PA = PB = PC = \text{radius}$

$$\Rightarrow PA^2 = PB^2 = PC^2 = r^2$$

$$\Rightarrow (x-1)^2 + (y-7)^2 = r^2 \quad \dots(i)$$

$$(x-7)^2 + (y+1)^2 = r^2 \quad \dots(ii)$$

$$\text{Also } (x-8)^2 + (y-6)^2 = r^2 \quad \dots(iii)$$

Subtracting (ii) from (i)

$$(x^2 + 1 - 2x + y^2 + 49 - 14y) - (x^2 + 49 - 14x + y^2 + 1 + 2y) = 0$$

$$\Rightarrow 12x - 16y = 0$$

$$y = \frac{3}{4}x \quad \dots(iv)$$

Subtracting (iii) from (ii)

$$\Rightarrow (x^2 + 49 - 14x + y^2 + 1 + 2y) - (x^2 + 64 - 16x + y^2 + 36 - 12y) = 0$$

$$\Rightarrow 2x + 14y - 50 = 0$$

$$\Rightarrow x + 7\left(\frac{3}{4}x\right) - 25 = 0$$

$$\Rightarrow \frac{25x}{4} = 25$$

$$\Rightarrow x = 4$$

$$\text{From (iv) } y = \frac{3}{4}x = \frac{3}{4} \times 4$$

$$y = 3.$$

The centre is $P(4, 3)$.

$$\begin{aligned} \text{Also radius, } r &= PA = \sqrt{(4-1)^2 + (3-7)^2} \\ &= \sqrt{9 + 16} = 5 \text{ units.} \quad \text{Ans.} \end{aligned}$$

Question 13. Find the image of a point $(-1, 2)$ in the line joining $(2, 1)$ and $(-3, 2)$.

Solution : Let $D(\alpha, \beta)$ be the image of point $C(-1, 2)$ in the line joining the points $A(2, 1)$ and $B(-3, 2)$.

Since, AB is the perpendicular bisector of CD .

So, Slope of $AB \times$ Slope of $CD = -1$

$$\Rightarrow \frac{2-1}{-3-2} \times \frac{\beta-2}{\alpha+1} = -1$$

$$\Rightarrow \frac{1}{-5} \times \frac{\beta-2}{\alpha+1} = -1$$

$$\Rightarrow \beta - 2 = 5\alpha + 5$$

$$\Rightarrow 5\alpha - \beta + 7 = 0 \quad \dots(i)$$

Equation of line AB ,

$$y - 1 = \frac{2-1}{-3-2}(x - 2)$$

$$\Rightarrow y - 1 = \frac{1}{-5}(x - 2)$$

$$\Rightarrow -5(y - 1) = x - 2$$

$$\Rightarrow x - 2 + 5y - 5 = 0$$

$$\Rightarrow x + 5y - 7 = 0 \quad \dots(ii)$$

Since, midpoint M of $CD \left(\frac{\alpha-1}{2}, \frac{\beta+2}{2} \right)$ lies on

AB .

$$\frac{\alpha-1}{2} + 5 \left(\frac{\beta+2}{2} \right) - 7 = 0$$

$$\Rightarrow \alpha - 1 + 5\beta + 10 - 14 = 0$$

$$\Rightarrow \alpha + 5\beta - 5 = 0 \quad \dots(iii)$$

Solving (i) and (iii), we get

$$\alpha = \frac{-15}{13} \text{ and } \beta = \frac{16}{13}$$

Hence, coordinates of D are $\left(-\frac{15}{13}, \frac{16}{13} \right)$. Ans.

Question 14. The line through $P(5, 3)$ intersects Y axis at Q .

(i) Write the slope of the line.

(ii) Write the equation of the line.

(iii) Find the coordinates of Q.

Solution :

(i) $m = \tan \theta = \tan 45^\circ$
 $m = 1$

(ii) Equation of line PQ

$$y - y_1 = m(x - x_1)$$

$$y - 3 = 1(x - 5)$$

$$y - 3 = x - 5$$

$$\Rightarrow x - y - 2 = 0$$

(iii) Equation of PQ is

$$x - y - 2 = 0$$

Put $x = 0$ (coordinates of Q)

$$-y - 2 = 0$$

$$\Rightarrow y = -2$$

So, coordinates of Q (0, -2).

Question 15. Find the value of 'a' for which the following points A (a, 3), B (2, 1) and C (5, a) are collinear. Hence find the equation of the line.

Solution : Equation of line passing through AC is

$$(y-3) = \left(\frac{a-3}{5-a} \right) (x-a)$$

As if A, B and C are collinear then B will satisfy it, i.e.,

$$\begin{array}{ccc} \bullet & \bullet & \bullet \\ A(a, 3) & B(2, 1) & C(5, a) \end{array}$$

$$(1-3) = \left(\frac{a-3}{5-a} \right) (2-a)$$

$$-2(5-a) = (a-3)(2-a)$$

$$-10+2a = 2a-6-a^2+3a$$

$$a^2-3a-4 = 0$$

$$a^2-4a+a-4 = 0$$

$$a(a-4)+1(a-4) = 0$$

$$(a-4)(a+1) = 0$$

$$\Rightarrow a = 4 \text{ or } -1. \quad \text{Ans.}$$

Thus, required equation of straight line is

$$(y-3) = \left(\frac{4-3}{5-4} \right) (x-4)$$

$$y-3 = \left(\frac{1}{1} \right) (x-4)$$

$$x-y-1 = 0$$

$$\text{or } (y-3) = \left(\frac{-1-3}{5+1} \right) (x+1)$$

$$(y-3) = \left(\frac{-4}{6} \right) (x+1)$$

$$y-3 = \frac{-2}{3} (x+1)$$

$$3y-9 = -2x-2$$

$$2x+3y-7 = 0, \quad \text{Ans.}$$

Question 16. If the image of the point (2,1) with respect to the line mirror be (5, 2). Find the equation of the mirror.

Solution : Let CD be the line mirror with slope m_1 .

Now the slope of the line joining A(2, 1) and B(5, 2).

$$m_2 = \frac{2-1}{5-2} = \frac{1}{3}$$

Since $CD \perp AB$

So, $m_1 m_2 = -1$

$$\Rightarrow m_1 \times \frac{1}{3} = -1$$

$$\Rightarrow m_1 = -3.$$

Now mid point of AB = $\left(\frac{2+5}{2}, \frac{1+2}{2} \right) = \left(\frac{7}{2}, \frac{3}{2} \right)$

Equation of the mirror CD,

$$y - y_1 = m(x - x_1)$$

$$\Rightarrow y - \frac{3}{2} = -3 \left(x - \frac{7}{2} \right)$$

$$\Rightarrow y - \frac{3}{2} = -3x + \frac{21}{2}$$

$$\Rightarrow 2y - 3 = -6x + 21$$

$$\Rightarrow 6x + 2y - 3 - 21 = 0$$

$$\Rightarrow 6x + 2y - 24 = 0$$

$$\text{or } 3x + y - 12 = 0.$$

Ans.

Question 17. The vertices of a triangle are $A(10, 4)$, $B(-4, 9)$ and $C(-2, -1)$. Find the

Solution : Let AD , BE and CF be the three altitudes of $\triangle ABC$ then

$$\begin{aligned} AD &\perp BC \\ BE &\perp CA \\ \text{and } CF &\perp AB. \end{aligned}$$

$$\text{Slope of } BC = \frac{-1 - 9}{-2 - 4} = -5$$

Since $AD \perp BC$
Slope of $BC \times$ slope of $AD = -1$

$$\text{Slope of } AD = \frac{-1}{-5} = \frac{1}{5}$$

Therefore $AD \perp BC$
Since, AD passes through $A(10, 4)$
So, equation of AD is

$$y - y_1 = m(x - x_1)$$

$$y - 4 = \frac{1}{5}(x - 10)$$

$$\Rightarrow 5y - 20 = x - 10$$

$$\Rightarrow x - 5y + 10 = 0 \quad \dots(i)$$

$$\text{Now, Slope of } AC = \frac{4 - (-1)}{10 - (-2)} = \frac{5}{12}$$

Since $BE \perp AC$

$$\text{Slope of } BE \times \text{Slope of } AC = -1$$

$$\text{So, Slope of } BE = \frac{-1 \times 12}{5} = -\frac{12}{5}$$

Equation of BE which passes through B(-4, 9) is

$$y - y_1 = m(x - x_1)$$

$$y - 9 = -\frac{12}{5}(x + 4)$$

or $12x + 5y + 3 = 0 \quad \dots(ii)$

Now Slope of AB = $\frac{4-9}{10+4} = -\frac{5}{14}$

Since $CF \perp AB$.

So,

$$\text{Slope of AB} \times \text{Slope of CF} = -1$$

$$\Rightarrow -\frac{5}{14} \times \text{Slope of CF} = -1$$

$$\Rightarrow \text{Slope of CF} = \frac{14}{5}$$

Equation of CF which passes through C(-2, -1) is

$$y - y_1 = m(x - x_1)$$

$$y + 1 = \frac{14}{5}(x + 2)$$

$$\Rightarrow 14x - 5y + 23 = 0 \quad \dots(iii)$$

Thus, the equation of altitudes of ΔABC are

$$x - 5y + 10 = 0$$

$$12x + 5y + 3 = 0$$

and $14x - 5y + 23 = 0.$ Ans.

Question 18. Given equation of line L_1 is $y = 4$.

- (i) Write the slope of line, if L_2 is the bisector of angle O.
- (ii) Write the coordinates of point P.
- (iii) Find the equation of L_2

Solution : Equation of L_1 is $y = 4$ (given)

(i) As L_2 is bisector of O

$\Rightarrow L_2$ is inclined at an angle of 45° with XX'

$\therefore$ Slope of $L_2 = m = \tan 45^\circ = 1$

$$(ii) \text{ Slope of } L_2 = \frac{4-0}{x-0} \Rightarrow 1 = \frac{4}{x} \Rightarrow x = 4$$

So coordinates of P are (4, 4).

(Since the slope of L_2 is 1, $L_2 \Rightarrow PM = OM$)

(iii) L_2 passes through O (0, 0), P (4, 4) and has slope $m = 1$

$\therefore$ Equation of L_2 is

$$y - y_1 = m(x - x_1)$$

$$y - 0 = 1(x - 0)$$

$$\text{or } y = x$$

$$\text{or } x - y = 0.$$

Ans.

Question 19. From the adjacent figure:

(i) Write the coordinates of the points A, B, and

(ii) Write the slope of the line AB.

(iii) Line through C, drawn parallel to AB, intersects Y-axis at D. Calculate the co-ordinates of D.

Solution : (i) Coordinates of the points A, B and C are (1, 3), (-3, -2) and (3, 0) respectively.

$$(ii) \text{ Slope of AB} = \frac{-2-3}{-3-1} = \frac{5}{4}$$

(iii) Line through C(3, 0) and parallel to AB.

$$\therefore \text{ Slope} = \frac{5}{4}$$

$\therefore$ Equation to the line is

$$y - y_1 = m(x - x_1)$$

$$y - 0 = \frac{5}{4}(x - 3)$$

$$4y = 5x - 15$$

This line intersects Y-axis at D.

$\therefore$ On solving

$$4y = 5x - 15$$

and $x = 0$, (Equation to Y-axis)

We get, $4y = -15$

$$y = -\frac{15}{4}$$

$\therefore$ Coordinates of point D are $\left(0, -\frac{15}{4}\right)$. Ans.

Graphical Depiction

Question 1. Given a line segment AB joining the points A (-4, 6) and B (8, -3). Find:
 (i) the ratio in which AB is divided by the y- axis.
 (ii) find the ordinates of the point of intersection.
 (iii) the length of AB.

Solution :

A (-4, 6), B (8, -3)

Let ratio be $k : 1$

(i) Where the y-axis divide AB, $x = 0$

$$\therefore x = \frac{m_1 x_2 + m_2 x_1}{m_1 + m_2}$$

$$\therefore 0 = \frac{k \times 8 + 1 \times (-4)}{k + 1}$$

$$\Rightarrow 8k - 4 = 0$$

$$\Rightarrow 8k = 4$$

$$\Rightarrow k = \frac{4}{8} = \frac{1}{2}$$

So, ratio be 1 : 2

$$\begin{aligned} \text{(ii) Now, } y &= \frac{1 \times (-3) + 2 \times 6}{1 + 2} \\ &= \frac{-3 + 12}{3} = 3 \end{aligned}$$

So, point of intersection (0, 3)

$$\begin{aligned} \text{(iii) } AB &= \sqrt{(8 + 4)^2 + (-3 - 6)^2} \\ &= \sqrt{(12)^2 + (-9)^2} \\ &= \sqrt{144 + 81} = \sqrt{225} \\ &= 15 \text{ units.} \end{aligned}$$
