Q1

$P(n) : n(n+1)$ is even

$P(3) : 3.(3+1)$ is even

Q2

$P(n) : n^3 + n$ is divisible by 3

$P(3) : 3^3 + 3$ is divisible by 3

$\Rightarrow P(3) : 30$ is divisible by 3.

$\therefore \quad P(3)$ is true

Now,

$P(4) : 4^3 + 3 = 67$ is divisible by 3

Since, 67 is not divisible by 3

So, $P(4)$ is not true

Q3

$P(n) : 2^n \geq 3n$

Given that $P(r)$ is true

$\Rightarrow \quad 2^r \geq 3r$

Multiplying both the sides by 2,

$2.2^r \geq 2.3r$

$2^{r+1} \geq 6r$

$\qquad \geq 3r + 3r$

$\qquad \geq 3 + 3r, \qquad\qquad\qquad$ [Since $3r \geq 3 \Rightarrow \qquad 3r + 3r \geq 3 + 3r$]

$2^{r+1} \geq 3(r+1)$

$\Rightarrow \quad P(r+1)$ is true

Q4

Here, $P(n) : n^2 + n$ is even

Given, $P(r)$ is true

$\Rightarrow \quad r^2 + r$ is even

$\Rightarrow \quad r^2 + r = 2\lambda$ $\qquad\qquad\qquad ---(1)$

Now,

$(r + 1)^2 + (r + 1)$

$= r^2 + 2r + 1 + r + 1$

$= (r^2 + r) + 2r + 2$

$= 2\lambda + 2r + 2$ $\qquad\qquad$ [Using equation (1)]

$= 2(\lambda + r + 1)$

$= 2\mu$

$\Rightarrow \quad (r + 1)^2 + (r + 1)$ is even

$\Rightarrow \quad P(r + 1)$ is true

Q5

$P(n) : 1 + 2 + 3 + --- + n = \dfrac{n(n+1)}{2}$ is true for all $n \in N$

Q6

$P(n): n^2 - n + 41$ is prime

$P(1): 1 - 1 + 41$ is prime
$\Rightarrow P(1): 41$ is prime
$\therefore P(1)$ is true.

$P(2): 2^2 - 2 + 41$ is prime
$\Rightarrow P(2): 43$ is prime
$\therefore P(2)$ is true.

$P(3): 3^2 - 3 + 41$ is prime
$\Rightarrow P(3): 47$ is prime
$\therefore P(3)$ is true.

$P(41): (41)^2 - 41 + 41$ is prime
$P(41): (41)^2$ is prime
$\Rightarrow \quad P(41)$ is not true

Q1

Let $P(n): 1+2+3+----+n = \dfrac{n(n+1)}{2}$

For $n = 1$,

LHS of P(n) = 1

RHS of P(n) $= \dfrac{1(1+1)}{2} 1 = 1$

Since, LHS = RHS

$\Rightarrow \quad P(n)$ is true for $n = 1$

Let $P(n)$ be true for $n = k$, so

$1+2+3+----+k = \dfrac{k(k+1)}{2}$ $\qquad\qquad ---(1)$

Now

$(1+2+3+----+k)+(k+1)$

$= \dfrac{k(k+1)}{2} + (k+1)$

$= (k+1)\left(\dfrac{k}{2}+1\right)$

$= \dfrac{(k+1)(k+2)}{2}$

$= \dfrac{(k+1)\left[(k+1)+1\right]}{2}$

$\Rightarrow \quad P(n)$ is true for $n = k+1$

$\Rightarrow \quad P(n)$ is true for all $n \in N$

So, by the principle of mathematical induction

$P(n): 1+2+3+----+n = \dfrac{n(n+1)}{2}$ is true for all $n \in N$

Q2

Let $P(n) : 1^2 + 2^2 + 3^2 + \ldots + n^2 = \dfrac{n(n+1)(2n+1)}{6}$

For $n = 1$

$P(1) : 1 = \dfrac{1(1+1)(2+1)}{6}$

$\qquad 1 = 1$

$\Rightarrow \qquad P(n)$ is true for $n = 1$

Let $P(n)$ is true for $n = k$, so

$P(k) : 1^2 + 2^2 + 3^2 + \ldots + k^2 = \dfrac{k(k+1)(2k+1)}{6} \qquad\qquad ---(1)$

We have to show that $P(n)$ is true for $n = k + 1$

$\Rightarrow \qquad 1^2 + 2^2 + 3^2 + \ldots + k^2 + (k+1)^2 = \dfrac{(k+1)(k+2)(2k+3)}{6}$

So, $1^2 + 2^2 + 3^2 + \ldots + k^2 + (k+1)^2$

Let $P(n)$ is true for $n = k$

We have to show $P(n)$ is true for $n = k + 1$

i.e. $1 + 3 + 3^2 + \ldots + 3^k = \dfrac{3^{k+1} - 1}{2}$

Now,

$\left\{ 1 + 3 + 3^2 + \ldots + 3^{k-1} \right\} + 3^{k+1-1}$

Consider equation

$1 \times 1! + 2 \times 2! + 3 \times 3! + \ldots n \times n!$

Lets take $(n+1)! - n! = n! (n+1 - 1) = n \times n!$

Now substitue $n=1,2,3,4,\ldots n$ in above equation we get

$2! - 1! = 1 \times 1!$

$3! - 2! = 2 \times 2!$

$4! - 3! = 3 \times 3!$

....

$(n+1)! - n! = n \times n!$

Q29

Let P(n) be the statement given by

$P(n) : n^3 - 7n + 3$ is divisible by 3.

Step I:

$P(1) : 1^3 - 7(1) + 3$ is divisible by 3

$\because 1 - 7 + 3 = -3$ is divisible by 3

$\therefore P(1)$ is true.

Step II:

Let $P(m)$ is true. Then,

$m^3 - 7m + 3$ is divisible by 3

$\Rightarrow m^3 - 7m + 3 = 3\lambda$ for some $\lambda \in N$ ....(i)

We have to prove that $P(m+1)$ is true.

$(m+1)^3 - 7(m+1) + 3 = m^3 + 3m^2 + 3m + 1 - 7m - 7 + 3$

$\qquad\qquad = m^3 - 7m + 3 + 3m^2 + 3m + 1 - 7$

$\qquad\qquad = (m^3 - 7m + 3) + 3(m^2 + m - 2)$

$\qquad\qquad = 3[\lambda + (m^2 + m - 2)]$ which is divisible by 3

$\Rightarrow P(m+1)$ is true.

Let $P(n)$ be the statement given by

$P(n) : 1 + 2 + 2^2 + \cdots\cdots + 2^n = 2^{n+1} - 1$ for all $n \in N$.

$P(1) : 1 + 2^1 = 2^{1+1} - 1$

$\Rightarrow 1 + 2 = 4 - 1$

$\therefore P(1)$ is true.

Step II:

We have to prove that $P(m + 1)$ is true.

$7 + 77 + 777 + \cdots + \underset{m+1-\text{digits}}{777\ldots\ldots\ldots7} = 7 + 77 + 777 + \cdots + \underset{m-\text{digits}}{777\ldots\ldots\ldots7} + \underset{m+1-\text{digits}}{777\ldots\ldots\ldots7}$

$= \dfrac{7}{81}\left[10^{m+1} - 9m - 10\right] + 7\left[\underset{m+1-\text{digits}}{1111\ldots\ldots\ldots1}\right] \qquad \left[\text{Using } (i)\right]$

$= \dfrac{7}{81}\left[10^{m+1} - 9m - 10\right] + \dfrac{7}{9}\left[\underset{m+1-\text{digits}}{9999\ldots\ldots\ldots9}\right]$

$= \dfrac{7}{81}\left[10^{m+1} - 9m - 10\right] + \dfrac{7}{9}\left[10^{m+1} - 1\right]$

$= \dfrac{7}{81}\left[(1 + 9)10^{m+1} - 9m - 19\right]$

$= \dfrac{7}{81}\left[10 \times 10^{m+1} - 9(m + 1) - 10\right]$

$= \dfrac{7}{81}\left[10^{m+2} - 9(m + 1) - 10\right]$

$\Rightarrow P(m+1)$ is true.

Q43

$P(n) : 2^n \geq 3n$

It is given that $P(r)$ is true, so

$2^r \geq 3r$ $---(1)$

Multiplying both the sides by 2,

$2^r.2 \geq 3r.2$
$2^{r+1} \geq 6r$
$2^{r+1} \geq 3r + 3r$
$2^{r+1} \geq 3 + 3r$ $[\text{Since } 3r \geq 3, \ 6r \geq 3 + 3r]$

$2^{r+1} \geq 3(r+1)$

So, $P(r+1)$ is true

But for $r = 1$
$2 \geq 3$

It is true, so

$P(n)$ is not true for all $n \in N$ by PMI

Q44

$$S_n = 1^2 + 2 \times 2^2 + 3^2 + 2 \times 4^2 + \ldots\ldots$$

Using induction we first show this is true for n=2,

we get $S_2 = 1^2 + 2 \times 2^2 = 1 + 8 = 9$

From RHS, we have if n is even $S_n = \dfrac{n(n+1)^2}{2}$

$S_2 = \dfrac{2 \times 9}{2} = 9$

Now using induction we first show this is true also

for n=3, we get $S_3 = 1 + 8 + 9 = 18$

From RHS, we have if n is odd $S_n = \dfrac{n^2(n+1)}{2}$

$S_3 = \dfrac{9 \times 4}{2} = 18$

Lets assume above is true for n=k, we get

k is even, $S_k = 1^2 + 2 \times 2^2 + 3^2 + 2 \times 4^2 + \ldots\ldots + 2 \times k^2$ —-1

k is odd, $S_k = 1^2 + 2 \times 2^2 + 3^2 + 2 \times 4^2 + \ldots\ldots + k^2$ —-—-2

Now lets prove for n=k+1

If k is even, k+1 is odd we get

$S_{k+1} = 1^2 + 2 \times 2^2 + 3^2 + \ldots\ldots + 2 \times k^2 + (k+1)^2$ —-—3

From above relation, we get

$S_k = 1^2 + 2 \times 2^2 + 3^2 + 2 \times 4^2 + \ldots\ldots + 2 \times k^2 = \dfrac{k(k+1)^2}{2}$

Substitute this in 3, we get

$S_{k+1} = \dfrac{k(k+1)^2}{2} + (k+1)^2 = \dfrac{(k+1)^2(k+2)}{2}$

$= RHS$ (when '$k+1$'is odd)

Q45

Let P(n) be the statement given by

P(n) : The number of subsets of a set containing n distinct elements is 2^n

for all n ∈ N.

Step I:

$P(1) : 2^1 = 2$

For any set A contaiining 1 element, empty set and set A are two sets always subsets of A.

∴ P(1) is true.

Step II:

Let P(m) is true. Then,

A set containing m distinct elements has 2^m subsets..........(i)

We have to prove that P(m + 1) is true.

Let the set A has (m+1) elements.

A = {1,2,......,m,m+1}

A = {1,2,......,m} ∪ {m+1}

Now using (i) we can say that {1,2,......,m} being m elemets has 2^m subsets.

For {m+1}, empty set and set itself {m+1} are subsets.

So, {m+1} has 2 subsets.

⇒ Set A has $2^m + 2$ subsets

⇒ Set A has 2^{m+1} subsets

⇒ P(m+1) is true.

Hence by the principle of mathematical induction, the given result is true for all n ∈ N.

Q46

Let $P(n)$ be the statement given by

$P(n): a_n = 3 \times 7^{n-1}$ for all $n \in N$.

Step I:

$P(2): a_2 = 3 \times 7^{2-1} = 21$

Given that $a_k = 7\, a_{k-1}$ for all natural numbers $k \geq 2$

$a_2 = 7a_1 = 7 \times 3 = 21$

$\therefore P(2)$ is true.

Step II:

Let $P(m)$ is true. Then,

$a_m = 3 \times 7^{m-1}$.........(i)

We have to prove that $P(m+1)$ is true.

$a_{m+1} = 7a_m$

$a_{m+1} = 7 \times a_m$

$a_{m+1} = 7^1 \times 3 \times 7^{m-1}$...........$\left[\text{from(i)} \right]$

$a_{m+1} = 3 \times 7^{m-1+1}$

$a_{m+1} = 3 \times 7^m$

$\Rightarrow P(m+1)$ is true.

Hence by the principle of mathematical induction, the given result is true for all $n \in N$.

Q47

Let $P(n)$ be the statement given by

$P(n): x_n = \dfrac{2}{n!}$ for all $n \in N$.

Step I:

$P(2): x_2 = \dfrac{2}{2!} = 1$

Given that $x_k = \dfrac{x_{k-1}}{n}$ for all natural numbers $k \geq 2$

$x_2 = \dfrac{x_1}{2} = \dfrac{2}{2} = 1$

$\therefore P(2)$ is true.

Step II:
Let $P(m)$ is true. Then,

$x_m = \dfrac{2}{m!} \ldots \ldots (i)$

We have to prove that $P(m+1)$ is true.

$x_{m+1} = \dfrac{x_{m+1-1}}{m+1}$

$x_{m+1} = \dfrac{x_m}{m+1}$

$x_{m+1} = \dfrac{\dfrac{2}{m!}}{m+1} \ldots \ldots \ldots \left[\text{from}(i)\right]$

$x_{m+1} = \dfrac{2}{m!(m+1)}$

$x_{m+1} = \dfrac{2}{(m+1)!}$

$\Rightarrow P(m+1)$ is true.

Hence by the principle of mathematical induction, the given result is true for all $n \in N$.

Q48

Let P(n) be the statement given by

$P(n): x_n = 5 + 4n$ for all $n \in N$.

Step I:

$P(1): x_1 = 5 + 4(1) = 5 + 4 = 9$

Given that $x_k = 4 + x_{k-1}$ for all natural numbers k

$x_1 = 4 + x_0 = 4 + 5 = 9$

$\therefore P(1)$ is true.

Step II:

Let P(m) is true. Then,

$x_m = 5 + 4m \dots\dots(i)$

We have to prove that P(m + 1) is true.

$x_{m+1} = 4 + x_{m+1-1}$

$x_{m+1} = 4 + x_m$

$x_{m+1} = 4 + 5 + 4m \dots\dots\dots[from(i)]$

$x_{m+1} = 5 + 4(m + 1)$

$\Rightarrow P(m+1)$ is true.

Hence by the principle of mathematical induction, the given result is true for all $n \in N$.

Step I:

$P(2): \sqrt{2} = 1.4142$

$\dfrac{1}{\sqrt{1}} + \dfrac{1}{\sqrt{2}} = 1 + \dfrac{1}{1.4142} = 1 + 0.7071 = 1.7071$

$\therefore \sqrt{2} < \dfrac{1}{\sqrt{1}} + \dfrac{1}{\sqrt{2}}$

$\therefore P(2)$ is true.

Step II:

$\sqrt{m} < \dfrac{1}{\sqrt{1}} + \dfrac{1}{\sqrt{2}} + \dfrac{1}{\sqrt{3}} + \ldots\ldots + \dfrac{1}{\sqrt{m}} \ldots\ldots\ldots(i)$

We have to prove that P(m+1) is true.

$\dfrac{1}{\sqrt{1}} + \dfrac{1}{\sqrt{2}} + \dfrac{1}{\sqrt{3}} + \ldots\ldots + \dfrac{1}{\sqrt{m}} > \sqrt{m} \ldots\ldots\ldots[\text{from}(i)]$

$\dfrac{1}{\sqrt{1}} + \dfrac{1}{\sqrt{2}} + \dfrac{1}{\sqrt{3}} + \ldots\ldots + \dfrac{1}{\sqrt{m}} + \dfrac{1}{\sqrt{m+1}} > \sqrt{m} + \dfrac{1}{\sqrt{m+1}}$

$\dfrac{1}{\sqrt{1}} + \dfrac{1}{\sqrt{2}} + \dfrac{1}{\sqrt{3}} + \ldots\ldots + \dfrac{1}{\sqrt{m}} + \dfrac{1}{\sqrt{m+1}} > \dfrac{\sqrt{m^2+m}+1}{\sqrt{m+1}}$

$\dfrac{1}{\sqrt{1}} + \dfrac{1}{\sqrt{2}} + \dfrac{1}{\sqrt{3}} + \ldots\ldots + \dfrac{1}{\sqrt{m}} + \dfrac{1}{\sqrt{m+1}} > \dfrac{\sqrt{m^2}+1}{\sqrt{m+1}}$

$\dfrac{1}{\sqrt{1}} + \dfrac{1}{\sqrt{2}} + \dfrac{1}{\sqrt{3}} + \ldots\ldots + \dfrac{1}{\sqrt{m}} + \dfrac{1}{\sqrt{m+1}} > \dfrac{m+1}{\sqrt{m+1}}$

$\dfrac{1}{\sqrt{1}} + \dfrac{1}{\sqrt{2}} + \dfrac{1}{\sqrt{3}} + \ldots\ldots + \dfrac{1}{\sqrt{m}} + \dfrac{1}{\sqrt{m+1}} > \sqrt{m+1}$

$\Rightarrow P(m+1)$ is true.

Hence by the principle of mathematical induction, the given result is true for all $n \in N$.
